**NEW QUESTION: 1**

Active discovery methods may impact the platform used for monitoring.

- A. True
- B. False

**Answer: A**

Explanation:

There are two types of discovery methods: active and passive. Active discovery methods can run processes that are detrimental and can impact a system.

They normally require an agent.  
With passive discovery methods, data is obtained in a non-impact, non-intrusive manner, with no agents.  
Obtaining and interpreting/presenting data such as this normally requires more experience.

**NEW QUESTION: 2**

You need to prepare the environment to support the planned changes for Appl.  
In which order should you perform the actions? (To answer, move all of the actions from the list of actions to the answer area and arrange them in the correct order.)  
Build List and Reorder:

**Answer:**

Explanation:

Explanation:

"A Composite Solution With Just One Click" - Certification Guaranteed 16 Microsoft 70-246 Exam

Explanation:

- Box 1: Create an IP address pool.
- Box 2: Install the provider for the hardware load balancer
- Box 3: Add a hardware load balancer
- Box 4: Create a Virtual IP (VIP) template
- Box 5: Copy and modify the Appl service template.

Note:

- \*(box 1) When you create a static IP address pool for a VM network, VMM can assign static IP addresses to Windows-based virtual machines (running on any supported hypervisor platform) that use the VM network. By using static IP address pools, IP address management for the virtual environment is brought within the scope of the VMM administrator.
- \*(Box 2, Box 3) Prerequisite for adding a Hardware Load balancer include:  
You must obtain the load balancer provider from the load balancer vendor, and install the provider on the VMM management server.
- \*Setting the load balancer affinity enables you to provide some control over which load balancer will be used for a service. This is based on logical network information. VMM uses this information to determine the valid static IP address pools that are accessible from both the load balancer and the host group that the service tier will be deployed to.
- \*By adding load balancers to VMM management and by creating associated virtual IP templates (VIP templates), users who create services can automatically

provision load balancers when they create and deploy a service.

\*(box 4) A VIP template contains load-balancer-related configuration settings for a specific type of network traffic. For example, you can create a template that specifies the load-balancing behavior for HTTPS traffic on a specific load balancer by manufacturer and model.

\*(box 5) A load balancer must be configured before you deploy a service. After a service is deployed, you cannot add a load balancer by updating the service.
